0% detected as AI

The percentage indicates the combined amount of likely AI-generated text as well as likely AI-generated text that was also likely AI-paraphrased.

Caution: Review required.

It is essential to understand the limitations of AI detection before making decisions about a student's work. We encourage you to learn more about Turnitin's AI detection capabilities before using the tool.

Detection Groups

0 AI-generated only 0%

Likely AI-generated text from a large-language model.

0 AI-generated text that was AI-paraphrased 0%

Likely AI-generated text that was likely revised using an AI-paraphrase tool or word spinner.

Disclaimer

Our AI writing assessment is designed to help educators identify text that might be prepared by a generative AI tool. Our AI writing assessment may not always be accurate (it may misidentify writing that is likely AI generated as AI generated and AI paraphrased or likely AI generated and AI paraphrased writing as only AI generated) so it should not be used as the sole basis for adverse actions against a student. It takes further scrutiny and human judgment in conjunction with an organization's application of its specific academic policies to determine whether any academic misconduct has occurred.

Frequently Asked Questions

How should I interpret Turnitin's AI writing percentage and false positives?

The percentage shown in the AI writing report is the amount of qualifying text within the submission that Turnitin's AI writing detection model determines was either likely AI-generated text from a large-language model or likely AI-generated text that was likely revised using an AI-paraphrase tool or word spinner.

False positives (incorrectly flagging human-written text as AI-generated) are a possibility in AI models.

AI detection scores under 20%, which we do not surface in new reports, have a higher likelihood of false positives. To reduce the likelihood of misinterpretation, no score or highlights are attributed and are indicated with an asterisk in the report (*%).

The AI writing percentage should not be the sole basis to determine whether misconduct has occurred. The reviewer/instructor should use the percentage as a means to start a formative conversation with their student and/or use it to examine the submitted assignment in accordance with their school's policies.

What does 'qualifying text' mean?

Our model only processes qualifying text in the form of long-form writing. Long-form writing means individual sentences contained in paragraphs that make up a longer piece of written work, such as an essay, a dissertation, or an article, etc. Qualifying text that has been determined to be likely AI-generated will be highlighted in cyan in the submission, and likely AI-generated and then likely AI-paraphrased will be highlighted purple.

Non-qualifying text, such as bullet points, annotated bibliographies, etc., will not be processed and can create disparity between the submission highlights and the percentage shown.

Plagiarism Undertaking

We take full responsibility of the work conducted during civics and Community Engagement project titled, “**ilm-o-fun**”. We solemnly declare that the work presented in the project is done solely by me and my group with no significant help from any other person; however, small help wherever taken is duly acknowledged. We have also written the complete report by ourselves. Moreover we have not presented this project (or substantially similar work) or any part of the project previously to any other degree awarding institution within Pakistan or abroad.

We understand that the School of Computing of National University Computer and Emerging Sciences has zero tolerance policy towards plagiarism. Therefore we as an author of the above mentioned work solemnly declare that no portion of our report has been plagiarized and any material used in the project from other sources is properly referenced.

We further understand that if we are found guilty of any form of plagiarism in my project work even after my graduation, the university reserves the right to revoke my bachelors degree.

Executive Summary

As a part of our Civics and Community Engagement course, our group initiated the project titled “**ilm-o-fun**”. With the collaboration of SOS Hermann Gmeiner School, we aimed to teach programming and other essential technical skills to children of our target age groups, i.e. 16 to 18 year olds. We planned to go over the span of 8 weeks at 2 hours/week. But we ended up achieving a total of 25 hours, albeit in a larger span of weeks.

Our initial plan included following a strict syllabus, starting with programming basics, slowly progressing towards having children make a game in groups using PyGame. However the students’ reaction added with our miscalculations about their skill levels and interest caused heavy changes to our targets. We tried new methods each visit, diversifying according to the needs of the students. We employed focus groups for the same reason.

By the end of our initiative we may not have been able to make that game, and not each child was a programmer. But we sure were able to connect with children on a deeper level, have conversations about issues they faced or interests they had, and overall leave with positive remarks. As we had already decided – even a single child picking up on a skill was a win for us.

Acknowledgement & Dedications

I would like to express my deepest gratitude to all those who made our Civics and Community Engagement project just more than a lousy requirement, but rather an experience to remember.

Starting with our course instructor **Ma'am Tayyaba** for her valuable guidance and continuous encouragement, replying to all those emails being sent at 3 in the morning. I am also deeply thankful to **Mr. Jamal**, Regional Coordinator SOS Children's Village, who did not only let us in after we were initially rejected in our mass outreach emails, but also did his best to accommodate us during our sessions. I cannot leave out **Ms. Maryam**, Principal SOS Hermann Gmeiner School Islamabad, without whom we would have never had access to those computers and school facilities.

A very heartfelt thanks goes out to **all of those children** who we taught. At times we had issues understanding each other, but nonetheless we made a lot of good memories. Your spirits, eagerness to learn and smiles left a lasting impact on us. You reminded us how every child has immense potential – all they need is a chance to show it off.

And last but not least, a very profound thank you to **all the team members** of this project. From sacrificing early morning sleeps to staying in late night meetings for deciding what to teach. From a rough start to always having each other's backs.

1) INTRODUCTION

1.1) Introduction to the Project:

As all of us sat down to brainstorm ideas for our project, we all gravitated towards the concept of 'skill-based learning'. It aligned amongst activities all group members could perform. Furthermore it was also a beneficial movement in the long run, as even if a single child picked up on a skill, it was a win for us. Thus marked the creation of the *ilm-o-fun* initiative.

1.2) Objectives and Significance of the Project:

Our main objective was simple – focusing on non-conventional subjects and services which organizations we were targeting would usually overlook. Our target age group identified was between 16-18 year olds. We would go and educate them about all the skills which we could teach them, and then give them options to choose from whatever they found better. To keep things engaging, our sessions would be gamified, employing focus groups where necessary as well.

Activities included but were not limited to: **Programming Basics, Canva, Web Designing, Game Designing** and various **Team-Building activities**.

1.3) Need Assessment:

This portion ended up being a great matter of argue for the group, as it revolved around whether modern degrees were important or not. But we clarified amongst ourselves and to any organizations we went to that we were not here to implant the concept of not pursuing further education, but rather put emphasis on the fact that modern jobs prefer skilled people over somebody with degrees but no skills. And keeping in mind the situation most of these children would be in, and how funding is already an issue, it might as well be a better alternative if they would build upon the foundation we laid, and not have to put all that money towards a degree.

1.4) Alignment of Specific SDGs with Project Goals:

Our project mainly focuses upon *SDG 4: Quality Education*. We could stretch to fix our project within multiple SDGs, such as gender equality etc. But we decided to stick with one and focus on it. Our primary focus was on 2 subsections of this SDG, namely:

SDG 4.4: *By 2030, substantially increase the number of youth and adults who have relevant skills, including technical and vocational skills, for employment, decent jobs and entrepreneurship.*

SDG 4.7: *By 2030, ensure that all learners acquire the knowledge and skills needed to promote sustainable development, including, among others, through education for sustainable development and sustainable lifestyles, human rights, gender equality, promotion of a culture of peace and non-violence, global*

citizenship and appreciation of cultural diversity and of culture's contribution to sustainable development.

This alignment provided a clear framework to guide our planning and implementation. It also helped us remember what our main goal was during each of our visits. A detailed section about the contribution of our project toward this SDG is in the [Outcomes and Impacts](#) section below.

2) PROJECT DESCRIPTION

2.1) Project Activities

2.1.1) Fostering Relationships and Creating Rapport

To catch the attention of students and to make a friendly relationship with them, we started with fun activities. We began with icebreakers which included paired intros and card games. More active participation games like football, UNO and memory game were added to support community building. Encouragement of self-expression and creativity was evident through Pictionary which enhanced togetherness as students and facilitators.

2.1.2) Programming and Technical Education

The main component of our project included the execution of teaching programming and technical skills. The installation of relevant programming applications like PyCharm; other MSYS2 and Python IDEs, Visual Studio Code, were also covered during the sessions. Teaching commenced with an introductory course on programming which covered fundamental concepts such as variables, loops, and conditionals with Python as the primary language. The students were given simple and practical tasks starting from building simple calculators to writing introductory programs in C++. An assignment was also given to check progress. Later on when we realized that not all the students are interested in learning one single topic, which was totally natural, we designed focus groups to enable all the students to progress at their own pace and engage in peer mentoring, mutual support, and collaborative problem-solving.

2.1.3) Creative and Cognitive Activities

To encourage creativity and critical thinking, a mix of creative and cognitive activities were held. Storytelling, word games, and memory games focused on improving language skills and mental agility. Group activities such as the whisper challenge and scrambling words encouraged teamwork and friendly interactions. We also taught them how to use Canva, its different features so that they can try out graphic designing as well. Along with this in Scratch, students practiced basic logic building, further expanding their imagination.

2.1.4) Social Development and Motivation

Social and emotional development was balanced with a mix of recreational and motivational approaches. Students also participated in sports and group activities as

physical and mental outlets, which fostered peer relationships. Besides these, snack distribution activity was organized after Eid to promote caring and community spirit. Certificate awarding was organized at the end of the project, which further enhanced self-esteem and motivated students by celebrating their efforts and fostering a culture of support and achievement. All these activities combined contributed to a positive and dynamic from floor to ceiling, learning environment throughout the project.

2.2) Timeline and Resources Used

2.2.1) Timeline of Visits

The project spanned multiple months covering 10 visits which amounted to around 25 hours of onsite work. This does not include the time being put in the background for session planning etc. The duration of each visit also varied between 1-4 hours. The timeline began with trust building and logistical triage, moved to programming level instruction and creatively guided workshops and later included the use of science & teamwork along with structuring tools like Canva and Scratch. Each visit had a general goal, but all lessons were interconnected in order to maximize learning and participation:

- I. **Visit 01 (3rd March - 2 hours):** Building rapport using memory games and icebreakers
- II. **Visits 02-03 (10th & 18th March - 2+2 hours):** Learning intro level programming and Python basics through Pictionary style interactive play.
- III. **Visits 04-05 (24th March-11th April - 4+3 hours):** Logic Science Games and creative drawing exercises.
- IV. **Visits 06-07 (11th to 17th April - 2.5+2.5 hours):** Advanced Storytelling, Creative Writing and Soft Skills training.
- V. **Visits 08-09 (22nd -26th April - 1+3 hours):** Coding follow-ups along with practical role-play and mock interviews.
- VI. **Visit 10 (1st May - 3 hours):** Defining Executive Functions, collecting feedback, bonding games, and reflections.

2.2.2) Resources Used

- I. **Digital Tools:**
 - Coding instruction was conducted using Python and PyCharm.
 - Creative design activities were done using Canva.
 - Scratch was used for practice.
- II. **Learning and Creative Materials:**
 - Memory game cards.
 - Printed worksheets (python assignment).
- III. **Recreational and Motivational Items:**
 - Football and UNO cards for team building and outdoor activities.
 - Snacks and small tokens to encourage active participation and efforts and motivate expected results.

3) ETHICAL CONSIDERATIONS

3.1) Consent and Confidentiality

Before finalizing an organization, we met the people in charge and clearly communicated the fact that this project will be carried out for 8 weeks and include various activities that will need to be recorded through photos or videos, to serve as evidence for our “Civics and Community Engagement” course, and will also be used in our reports and presentations. While some organizations flat out refused this request, the organization that we finalized, SOS, allowed us to take photos or record videos with the following guidelines:

- No individual photo or video of a student or teacher will be taken
- Photos and videos will only be recorded for group activities

These requests seemed reasonable to us. The children also didn't have an issue with their photos being taken and we were able to fulfill this requirement with no problems.

We also made sure that no name of any student or teacher from SOS was mentioned in any presentation or report to maintain confidentiality as well.

3.2) Cultural Sensitivity

The project group consisted of people from many diverse cultures, so we already had to make sure that a culturally sensitive and respectful environment was maintained. At the organization, we didn't have to face the issue of any student mentioning their culture or being disrespectful towards any other culture, and us as a group also made sure not to mention or highlight any specific culture. As no conversations about cultures were initiated, we didn't have to deal with any problem in this regard and could focus more on teaching and more productive tasks. The one noticeable aspect of SOS we noticed was that every child at that place considers each other as their siblings and live together like they are an actual family, even if there are cultural differences which makes the overall environment for the children much better.

3.3) Sustainability and Minimal Environmental Effects

Regarding environmentally friendly practices, all our activities carried throughout our 25 hours were completed with sustainable practices kept in mind. Almost all of our activities were carried out on computers in their computer lab which were already being used by the students, so no extra expenses or resources were required from them to be arranged. Our use of paper was also minimal, using it only for printout for an assignment for the students consisting of 6 pages for 10 to 11 students, so throughout the project a total of almost 60 pages were used. Our activities also allowed the students to practice them when we are not present using their preexisting resources which gives them sustainable working environment even in the future and can carry out a continuous learning habit.

3.4) Specific Regulations or Guidelines

Due to the delicate situation of the children present at SOS the group made it a point not to discuss any topics pertaining to the personal lives of the students to not come across as

ignorant to their situation. If there was any incident with the students, it was unanimously decided by the group to not raise the issue any further as the children do not have any role models, rather we are the ones who are acting as role models in their lives.

4) OUTCOMES AND IMPACTS

4.1) Detailed Outcomes:

The SOS Children's Village project started with a focused goal which involved providing students with fundamental digital skills and programming knowledge through Python programming and Canva design software. Our initial strategy involved delivering structured teaching sessions to all participants because we wanted them to create a basic Python game before we finished our time at the SOS Children's Village. However, reality unfolded differently. At first we observed that most students interacted either with complete disinterest or got overwhelmed by the learning material. Our teaching strategy started with standard delivery methods because we taught the same way to students at all engagement levels but it failed to produce the results we wanted.

Our strategy required modification when we became conscious of its inadequate nature. We sought to serve students better by creating different interest-based focus groups instead of using a standardized path for all students. The team members selected field-specific topics that they could teach effectively to student groups with similar interests. A total of four focus groups were formed because students expressed different interests between graphic design with Canva and game development, HTML, basic science concepts, and Python programming. The adaptive system built a customized learning space, which made the experience more interesting to students.

The major consequence of this educational method adjustment led to improved student involvement. The students proved themselves more active learners when our teaching methodology incorporated individual student interests. We did manage to foster curiosity about different subjects while fighting through time limitations and decreasing motivation levels towards developing our intended Python game completely.

Moreover, this project transformed the entire team into a different group of professionals. Classroom management becomes difficult for teachers when they must manage students with different attention spans between activities that each interest differently. Our training focused on developing adaptable communication skills with patience, through which we learned to create classrooms based on student needs.

4.2) Contribution to SDG 4 – Quality Education

This project fulfills the requirements of Sustainable Development Goal 4: Quality Education. The curriculum mattered less to us than satisfying students' interests while maintaining high-quality learning standards. we exposed students to digital tools like

Canva, Scratch, and coding languages like Python and C++ that are considered essential for one's academic growth in today's digital world.

A simple demonstration of Canva usage and HTML tag creation exposed students to extensive opportunities that exist outside their current surroundings. Since now they have the basic knowledge of it, they can go for web development in the future.

Since SDG 4 specifies that students need skills that prepare them for work. The students learned different skills in focus groups to accomplish this goal. Also our initiative was free from gender discrimination, ensuring that all students get equal attention. Additionally, we taught them in a friendly environment, free from cultural, background and ethnic conflicts. Most importantly, the sessions shifted student perceptions because numerous students believed initially that programming or design would be difficult for them. The vital basis of SDG 4 depends on such mental transformations.

4.2.1) Direct Impacts:

- Students acquired fundamental knowledge about Canva, Python and HTML, and Science based on their personal interests.
- The students participated in activities that exposed them to potential career-guiding tools, along with ideas.
- The students understood that SOS is just a platform towards achieving higher objectives and is not their final destination.
- Through the teaching practice our team members developed personal hands-on classroom experience along with an intense respect for the teaching occupation.

4.2.2) Indirect Impacts:

- SOS administration recognized our approach to flexible student-centered service because student-focused personalized interactions seldom exist.
- Students now possess directional guidance through which they identify additional platforms and tools for investigation.
- The students demonstrated mind shifts during their participation when many of them elevated their life expectations beyond their current perspectives.
- Our efforts created awareness throughout the community after sharing our reflective documentation with other students within our university group, family, and friends. which might lead to additional outreach initiatives.

5) DISCUSSION

Our ilm-o-fun initiative at SOS Village helped us understand the importance of teamwork, empathy and the transformative power of education. Entering as strangers in a group of six

leftover students, we learned to unite around a common goal: empowering children through teaching them soft skills for them to identify their passion and creativity. Planning each session and managing students, developed good leadership skills in us. Shifting to focus groups helped us develop patience and adaptability. Some students there, had been through extreme traumas, so they were usually quiet. We planned our sessions to include confidence building activities to make sure every student gets a voice. Small steps from our side made big impacts. Celebrating small achievements like a student's first "Hello World" in Python illuminated how small victories can spark lasting confidence.

5.1) Challenges:

As soon as we stepped foot inside of SOS we were met by a plethora of challenges. Starting with us reaching late, soaked in rain, only to find out our promised grades 9th and 10th have their exams, so we'll have to teach 7th and 8th instead.

Students lacked motivations to learn new skills. They preferred playing games on the lab computers instead of studying. We often found ourselves trying to get students to close their computers and to make them focus on the lecture. To cope with this problem we shifted our teaching methods to forming focus groups. This way we taught each student, what they were interested in learning. We gamified our sessions so that every student was invested.

We also faced the problem of resource constraints and external resistance at SOS. We had planned to give assignments to students there, but we were setback after knowing that those students didn't had access to computers after school timings. So the plan to give assignments was hindered. We taught students how to use compilers on their phones. This way they completed their assignments back at SOS village. Additionally, initial noncooperation from a few staff members and a strict teacher was eased by clearly explaining our objectives and by inviting them to observe positive student progress. Their attitude shifted after we explained our motives.

Reflecting on this initiative, we not only developed good technical and language skills, we learned creative problem solving, empathetic listening, sustaining high motivation and emerged as good teachers. The lessons and friendships this initiative gave us motivates us to continue our community work irrespective of the course requirements.

6) RECOMMENDATION

6.1) Recommendations For Upcoming Students:

6.1.1) Emotional Awareness

The best recommendation we can give to future students is to open their heart and mind when they go there. Be fully present, pay complete attention, and remember that the children at SOS come from tough backgrounds — even one sentence from them can make a big difference in their day. They should notice small details: if a child seems

uncomfortable, hesitant, or annoyed, they must respond with care. They should never act out of anger or frustration, even if a child seems disrespectful or disinterested—they should never take it personal. Being patient is the most important skill they'll need.

6.1.2) Interactive Sessions

They should avoid giving passive lectures where the kids just sit and listen. The children already go through multiple classes daily; the volunteers are supposed to be the fun part of their day. They must make their sessions interactive and student-led. First, they should understand what the children are interested in, then shape the activity around those interests.

6.1.3) Consistency Matters

They should be consistent and true to their words. Kids remember everything that's said and promised. If they tell the kids they'll visit on a certain day, then they must make sure they do. The children look forward to these things. Also, bringing small tokens like chocolates or treats can help handle situations where a child is upset or unmotivated. They should be prepared with calming techniques or backup plans to handle such moments with care.

6.1.4) Respect Rules

Finally, they must respect the organization's rules. They shouldn't argue with staff or try to change their systems. For example, at SOS, they had to write their names, ID card number, vehicle information, and entry/exit times — and that's fair. If the staff says no to photography or videos, they should accept it respectfully. Their role is to adapt to the system, not challenge it.

6.2) Recommendations For the Organization (SOS):

6.2.1) Build Continuity

One important recommendation for the organization is about student proposals: try to prioritize ideas that continue from previous efforts. For example, if a group previously taught children about technology, apps, or Python programming, and a new volunteer brings a similar proposal — encourage them to build on that instead of starting over from scratch. Repeating the same basics over and over doesn't help the children grow. Even for non-tech activities, try to create a learning flow — moving from one level to the next — so the students gain something new each time.

6.2.2) Timely Communication

Another crucial suggestion: if there are last-minute changes — like outside visitors or suspended classes — the volunteers must be informed in advance. In one case, the class we were assigned to wasn't available because the students were unavailable due to disciplinary reasons for 10 days, and we were only told about it when we went there. So, we had to adjust and change parts of our activities last minute. This kind of miscommunication causes frustration and wasted effort. Clear and timely communication from the organization is really important.

6.2.3) Feedback

There should also be a proper feedback system. Sometimes, despite all our planning, the activities don't work out because the kids are tired or simply not interested. NGOs should give volunteers feedback and suggestions, helping them adjust their plans accordingly. It would be helpful if the organization occasionally asked the children what they enjoy or want to learn. It doesn't have to be formal — even a casual check-in can help us design better, more meaningful sessions. A lot of the students are shy and might not openly share their thoughts in front of everyone, but they may open up to a trusted person around them and quietly mention what they liked or what they wish to do. Getting even small bits of this kind of feedback can make a big difference in planning future sessions.

7) CONCLUSION

In conclusion our goal from day one was simple but powerful: to give the students at SOS Village an interactive learning experience over 8 weeks — something different from their usual routine. We didn't just want to give them passive lectures; we wanted them involved, excited, and have some hands-on experience. From tech-based sessions like Python and Canva to creative ones like scramble and Chinese whisper, everything was planned with their interests in mind.

This project wasn't just about teaching skills — it was about planting a seed. The modern world is evolving quicker than ever, and it's a fact that most of the staff at SOS might not be too concerned about its relevance with the children. But that was the issue we identified and aimed to solve. In today's world, where technology is everywhere, these kids deserve the same exposure and opportunities as anyone else. Most of them might not get the chance to do full-time degrees, and that's the reality. But if we could help even one of them take that first step — learn something practical, gain confidence, and see that they *can* build a future using these tools — then we've done something meaningful.

And with that we have it, team ilm-o-fun, signing out.
